Abstract (en)

An automobile body and frame straightening apparatus comprises stationary support means, a frame for supporting an automobile, a plurality of automobile body frame attachment means to secure the automobile against movement relative thereto, and an automobile body and frame puller for straightening the body and frame of an automobile. The frame and the car supported thereon are capable of rotation relative to the automobile body and frame puller, and may be so rotated by actuation of a hydraulic cylinder device extending in a connected relationship between the stationary support means and the frame. The device may also be used to straighten the frame of other vehicles or objects.
