Abstract (en)
[origin: EP0164332A2] The constructional element (1) which can be constructed in the form of a building board, permanent formwork, casting mould for concrete or tube consists of optionally glassfibre-reinforced, curable synthetic resin and has an embedded areal reinforcement (2) which is preferably made from metal. The areal reinforcement increases the strength properties and if necessary can be prestressed or serve to fasten stiffening or connecting elements projecting from the areal part of the element. <IMAGE>
