Abstract (en)  
[origin: EP0164519A1] 1. Underwater tool comprising a bailing system for automatic discharge of a pressure vessel (3), in which the equipment (4) is to be operated in connection with the surrounding water, and in which the equipment (4) is maintained at a specific inside pressure related to the water depth by a gas pressure buffer (8) connected to the pressure vessel (3), whereas the internal pressure protects the pressure vessel (3) and the equipment (4) from pressure differences due to deep water conditions, characterized in that, between the pressure vessel and a power supply source (1) there is only an electric and/or signal link, via which the equipment (4) can be operated, and leakage water collecting in equipment (4) or in pressure vessels (3) can be bailed out independently from the gas pressure buffer (8) without any pump and in an adequate period of time.
