Abstract (en)

An auxiliary safety system for crane and particularly for tower crane with horizontal sewing jib. In order to give the greatest safety either to such slewing jib against yieldings of those mechanical members or elements which are provided to maintain them in their horizontal slowing state, and to the upper slewing section of the crane tower the axis of which is to be maintained in its vertical position within the forecast limits of tolerance, such auxiliary safety system comprises a first auxiliary safety means formed by tension ropes (20, 21) operating elastically through the co-operation of spiral springs (28) to maintain the jib/jibs (11, 12) in their horizontal slewing plane, and a second auxiliary safety means formed by a cage (16) extended upwards from the area of thrust bearing (15) between stationary and slewing sections (13, 14), respectively of crane tower and provided with a top collar (30) on the inner perimetrical surface of which rollers (31) mounted on said slewing section (14) are pushed elastically and rolling, in order to maintain the axis of this latter in its vertical, central position.
