Abstract (en)
[origin: EP0168247A2] An access floor structure consisting of one or more floor panels each supported at each corner on pedestal units, in which each floor panel comprises a plane rectangular laminar panel member formed of a wood composite material. A sheet of metal is mounted in touching contact with the lower surface of the panel member and has channels formed therein extending across the full width thereof. Metal support beams are mounted on opposite sides of the panel and are connected to and extend transversely of the channels in the sheet of metal so that the load on the panel is carried by the channels and the support beams to the pedestal units at the corners of the panel.
