Abstract (en)
[origin: EP0170868A1] 1. A very high natural-draught cooling tower whose jacket narrows upwardly from a base diameter (DO), to an exit opening, the height (Hn) being greater than the exit diameter (Dn) of the jacket, furniture elements (24, 25) being arranged to some extent in the jacket base (26) and being grouped to some extent around the outside thereof, the inner elements (24) being flowed through in countercurrent, characterized in that the jacket (20) has a ratio (Hn /Dn) of height (Hn) to exit diameter (Dn) of from 3, 5 and 7, the jacket is slender over the entire height (Hn), lateral perforations giving on the atmosphere are present in the jacket above the perforations (24, 25) around the periphery of the jacket (20), a roofing (29) covers the space (28) above the outside furniture elements (25) to above the height of the perforations (21), and the outer furniture elements (24, 25) are also flowed through in countercurrent.
