Abstract (en)
[origin: EP0171462A2] 1. Flowing material dispenser (1) with manual operation, particularly for liquid flowing material, with on both the inlet side and the outlet side leading to a discharge opening a bellows pump having a check valve (17, 18) automatically operated by differential pressure and which has as pump components (2, 3) a base part (2) to be arranged on a container for the flowing material and retaining a pump bellows (3) in the vicinity of one end, as well as the pump bellows, which is compressible with a pump plunger (4) acting on the other end of the bellows (3) and displaceable manually with respect to the base part (2), each check valve (17, 18) having two valve components (21, 27) movable against one another with in the closed position valve closing faces which are tightly engaged and whereof two are constructed in one piece with a pump component (2, 3), characterized in that the two valves (17, 18) are located in the vicinity of the remote ends of the pump bellows (3) and both valve components (21, or 27) of at least one valve (17, or 18) are constructed in one piece with the associated pump component (3 or 2).
