Abstract (en)

An adhesive cleaning device comprises a roll (3) of an adhesive-coated tape wound on a core (31) through which passes the axial portion (2) of a pushing handle (21). To show the direction in which the device should be pushed over a floor so as to pick up dirt, arrows (a) are printed on the tape surface. The dirty portions of the tape are removed to reveal fresh tape, as needed. The core may be made so as to be easily fractured and removed from the interior of the roll when the use of the roll of tape is finished. The tape may be only partially adhesive-coated; if the coating is in a series of lines, the spaces between the adhesive portions allow the roll to be deformed under pressure so that the area in contact with the floor is increased.
