Abstract (en)
[origin: US4864745A] The skiing boot (1) comprises a shell (2) and a leg part (3), which is pivotally moveable relative to the shell. The lower end portion (5) facing the toe of the boot is formed with a groove (7) for accommodating elements (6) having rubberlike elasticity. When the lower end portion (5) of the leg part has run up on or engaged the shell, the element (6) having rubberlike elasticity will be compressed as the pivotal movement toward the forward lean position is continued.
