Abstract (en)

[origin: WO8503816A1] A surface acoustic wave filter comprises an aluminum input transducer (5), an aluminum output transducer (2), an aluminum 3db coupler (4), an aluminum reflector (3), and a triangularly configured substrate (1) constructed from lithium niobate. In a specific configuration the lengths of the sides of the substrate are equal to approximately 6.06, 9.25 and 11.05 millimeters respectively. The triangular configuration not only reduces the amount of substrate material required but also attenuates the degree of "triple-transit" signal reflection encountered.
