Abstract (en)
[origin: WO8504052A1] A battery terminal connector with a plastics housing (10) has a laterally extending threaded stub (15) for the application of an insulating nut (23), which serves to press a contact device (16, 17) with applied cable (25, 26) against a battery terminal post (13). To enable connection of a starter cable without removal of the battery terminal connector, the contact device is formed with a rearward extension (27) which protrudes through the nut and a distance over the cable sheath (25). The risk of battery short-circuit by loss of tools or other elongate metallic articles is minimized in that the nut has two or more rearwardly extending legs (28).
