Abstract (en)
[origin: ES8605090A1] The circuit arrangement has sensors (ES,CR) assigned to spaces requiring different amounts of cooling and are coupled to a logic circuit (UG,OG) that assigns appropriate priorities to alternate the cooling between the spaces. - The sensors for the carbonated water are electrodes in the ice compartment at different distances from the cooling device. An NTC element (TR) may be a sensor. Priorities are specified and the logic performs given tasks and may be incorporated as a microprocessor.
