Abstract (en)
[origin: US4637321A] The known built-in ironing boards are disposed on a pull-out which is movably mounted in ways so it can be swung via parallelogram guide arm pairs from a lower position at rest into an upper working position. When ironing on such an ironing board, the pull-out must be pulled out first, whereupon the ironing board must be brought into the working position and locked therein. To facilitate handling, there is now provided a naturally flexible member in the form of a flexible connector such as a wire rope which is effective only when the pull-out is extended, in which position it connects the ways, or a part fixed thereto, to the ironing board. Shortly before the end of the pull-out motion of the pull-out, the ironing board is retained by the wire rope so that the parallelogram guide arm pair pivots upwardly, bringing the ironing board into its working position without requiring additional manipulations to accomplish this.
