Abstract (en)
[origin: EP0173084A2] The device has at least one locking element for closing and releasing the fixation, the locking element being movable by a foot switch arranged on the top side of the surfboard. The object of the invention is to design the device in such a way that the foot switch, in the locking position of the locking element, neither forms a stumbling edge nor can be activated unintentionally. This is achieved by virtue of the fact that the foot switch (15) can be lowered into an inoperative position in the locking position of the locking element (12). <IMAGE>
