Abstract (en)
[origin: EP0173094A1] 1. Plating barrel with a polygonal outline having a) an outer walling composed of several rectangular wall sections consisting of electrically nonconducting bars whose end regions are joined together in the abutting region formed by every two wall sections with each other, b) end walls which seal off the cavity surrounded by the outer walling at the end face, c) an electrical supply lead which connects a direct voltage source to a cathode situated in the interior of the plating barrel, characterized d) in that at least one electrically conducting bar (32) is additionally arranged between the nonconducting bars (30), e) in that at least one of the joints which hold the bar (32) in its appropriate wall section (12) is constructed as an electric current supply conductor (42), and f) in that electrical contact exists between the current supply conductor (42) and the supply lead (24).
