Abstract (en)

[origin: US4658251A] A heat seal monitoring device for a container, such as one containing a calogenic material, includes one or more seals, placed on a container surface element and having a plurality of electrically interconnected resistive components enclosed in a structure having a first material acting as a physical protection and a second material acting as a thermal insulation. Each initial cap seal is able to supply an electric signal representing the heat flux exchanged between the surface element and the seal.
