Abstract (en)

[origin: WO8601486A1] Machine provided with a plurality of pneumatic jacks, some of which being part of a subassembly movable with respect to the machine, characterized in that the shocks or jerks or operations are eliminated by using the combination of the following means: utilization of a counter-pressure network for each working phase of the jacks of the movable subassembly, in opposition with the rated pressure supply network and reduction of the masses of the movable subassembly in rotation and in translation, and/or insertion of flexible lines between the jacks on one hand and the speed regulator devices on the other hand (variable chokes and anti-return valves) which are transferred to the fixed parts of the machine.
