Abstract (en)

[origin: US4622797A] A webbed panel unit having two facings bordered at its edges by sections which abut at an angle to each other. Two abutting sections are connected to each other and to the double-faced webbed panel by a two-legged corner angle member, which is disposed in a cutout of the double-faced webbed panel. The legs of the angle member extend in and snugly conform to the ends of the two sections. The two facings of the webbed panel unit have edge portions which protrude into the sections. At least at one end of each section each edge portion is disposed in between the corner angle member and the adjacent inside surface of the section.
