Abstract (en)  
[origin: EP0174688A1] Container with cover, both made from plastics, which container can be hermetically closed by providing a seal between two engaging flanges of the container and the cover respectively and can subsequently be opened by breaking a thin wall section in the flange, which flange comprises a substantially vertical auxiliary wall (4), at some distance from the container (3) and externally around the container, which extends along some height in the upper region of the container and which is connected to the container wall by a circumferential connecting wall (5). The auxiliary wall has a thin wall section (21) beneath the junction with the connecting wall. The flange wall (9) of the cover is formed by a skirt of a hooded cover, which skirt, in the case of a closed container, envelops the auxiliary wall (4) and extends beyond the thin wall section (21) in such a way that below the thin wall section there are two contiguous flange sections (11, 10) of the container and the cover respectively, between which a seal (13) can be provided.
