Abstract (en)

[origin: WO8503872A1] Method of lowering blood glucose in vertebrates comprising administration of manganese-containing pharmaceutical preparations in appropriate ratios with arginine, leucine, ornithine, tryptophan and valine and in appropriate ratios as between the amino acids used to decrease the glucose level of the vertebrates having the blood sugar level lowered to within normal limits; these to be given in cumulative amounts appropriate to the individual patient in a schedule of treatment which varies in amount, frequency and the said ratios, which reflect the changing degrees of imbalance as the affected individual adjusts the glucose level to within normal limits.
