Abstract (en)  
[origin: EP0175258A2] 1. An apparatus for filling at least one cartridge (6) with softly-elastic composition (22), preferably silicone and the like jointing composition for gaps in a glazed leaf of a window or a door, disposed in a large container (1), with a support (5) for at least one cartridge (6), a pump (2) connected to the device by a pressure line (3) and with a switching device (14) for shutting down the pump (2) when the cartridge is completely filled, characterised in that the pump (2) is constructed as a barrel pump for conveying the composition (22), its pressure line (3) being connected to a nozzle-like filling piece (4) in which there is preferably a shut-off means, for fitment on or at least close association with the cartridge nozzle (7), and in that the switching means is constructed as an inductive switching device (14) which can be controlled by a magnet (12) adapted for movement together with a piston (11) in the cartridge (6).
