Abstract (en)

[origin: WO8503870A1] Method of raising blood glucose in vertebrates comprising administration of manganese-containing pharmaceutical preparations in appropriate ratios with isoleucine, methionine, phenylalanine, tyrosine and valine and in appropriate ratios as between the amino acids used to increase the blood glucose level of the vertebrate having the blood sugar level raised to within normal limits: these to be given in cumulative amounts appropriate to the individual patient in a schedule of treatment which varies in amount, frequency and the said ratios, all of which reflect the changing degrees of imbalance as the affected individual adjusts the glucose level to within normal limits.
