Abstract (en)

[origin: EP0176958A2] The formwork element is angular and has end faces forming an angle of 45 DEG . The lengths of its sides (32, 34) are matched to the modular dimension of the cuboid formwork elements, in combination with which it is laid around corners to produce a sloping wall between a longitudinal and transverse wall. In addition to the length portions of the sides (32, 34) in the modular dimension, a length addition (d) is provided in each case next to the bend. At a distance from a modular dimension (a) next to the length addition (d), the longer side (32) has an additional intermediate web (46) in order to be able to move a window close to the corner in the case of a bay. The size of the formwork elements permits the production of stairs using only two different steps in the region of the walls. <IMAGE>
