Abstract (en)
[origin: EP0177811A1] A control switch (1) having switch contacts, for example, for a group of light-emitting diodes (36), which switch contacts are completely covered externally and are mechanically opened and closed as a function of the angle of rotation, is directly combined with a power control unit (2) by flanges to form a structural unit, such that the switch shaft (13) of the power control unit (2) also operates the control switch (1) synchronously, the control switch (1) being mounted in the manner of an auxiliary switch. The control switch (1) is considerably flatter than the power control unit (2) so that it fits between the power control unit (2) and an equipment aperture (4) without any significant increase in the space requirement. <IMAGE>
