Abstract (en)

[origin: EP0178569A2] The work table has a rectangular table top which is supported by a table structure and is adjustable in height and inclination. A height adjustment of the table top which is easy to carry out with the simplest of table structures results due to the fact that, on each of the narrow sides, the table top supports a bearing unit with a structure support plate extending parallel to the associated narrow side of the table top, that a pair of connecting rods as table legs extending adjacently in parallel are linked onto each structure support plate, that the lower ends of the connecting rods are each linked onto a foot directed parallel to the associated table top and in the direction of the operating side, and that an arresting device is assigned at least to one connecting rod of each pair, by means of which arresting device the adjusted inclination of the connecting rods, directed towards the operating side of the table top, can be arrested. <IMAGE>
