Abstract (en)

[origin: EP0178715A1] The invention relates to a separating device for sideways removing a publication (6) from the lower side of a pile (2) of publications such as magazines, papers and the like, comprising a periodically activated suction table (3) moving to and for below said pile that can grip the frontal portion of the lowest publication as seen in the direction of removal. This separating device comprises a second suction table (4) that as seen in the direction of removal is positioned behind said first suction table, said two suction tables being controlled in such a way that the publication to be removed at first will be moved in the direction opposite to the direction of removal prior to its motion in the direction of removal. Due to this it is possible to remove publications with their open sides ahead without any restrictions.
