Abstract (en)

[origin: US4664359A] A furnace for heat-treating light alloy ingots comprises a heating chamber, which is flown through by hot gases and communicates with a stock inlet and with a stock outlet and contains between said stock inlet and outlet a conveyor for intermittently conveying the ingots, which lie on said conveyor and extend transversely to its direction of conveyance. The intermittent conveyor is accommodated in a heating shaft and consists of at least two juxtaposed vertical conveyor sections, which convey in mutually opposite directions and are interconnected by transfer means. A partition which divides the furnace shaft is provided between that conveyor section which is adjacent to the stock inlet and the next following conveyor section.
