Abstract (en)  
[origin: WO8404476A1] A guiding device for the rolling means in a basin rolling assembly, comprising a guide path (6) following the shape of the periphery of the basin and a support element (7) for the rolling means movable on rollers (8, 9, 12, 13, 14, 15) along the guide path. In order to guide the support element exactly along the guide path, a roller (13) running along the inside of the guide path is rigidly mounted in the support element. Along the outside of the guide path run two rollers (14, 15) located one after the other which are mounted to a jaw (16) which is movable with respect to the support element (7) in the radial direction of the guide path (6) and which, by means of its shanks, determines the angular position of the support element (7) with respect to the guide path. The guiding device is moreover provided with a resilient member (23) under the action of which the rollers (13, 14, 15) resiliently abut against the inside and outside of the guide path (6).
