Abstract (en)

A video signal reproducing apparatus includes a dynamic tracking head that dynamically scans or traces oblique recording tracks formed sequentially on a tape in its longitudinal direction while the tape is transported at variable speed to thereby reproduce a video signal from the tracks. The apparatus includes a jump control circuit (1) for generating a head displacement amount drive signal (JUA) to make the dynamic tracking head scan a specified track on the basis of tracking track information (TTI) specifying a track that the head should trace and head position information (PSI) indicative of the position of the head. The apparatus includes also video signal data storage means (8) and address control means (WT) for storing in the storage means (8), at a memory area thereof corresponding to a corresponding track, a video signal which is reproduced from the corresponding track and which is recorded in the track that the dynamic tracking head scans.
