Abstract (en)

The present invention relates to an improved type hair-drier (2) with slant and swing handle (4) which can be employed for professional as well as for personal use. When employed for professional use, the handle (4) is slanted in the rearward direction to provide a correct direction of the hair blow; by contrast, when employed for personal use, the handle is requested to be slanted in the forward direction, which provides the correct slope of the blowing body. In the hair-drier of the present invention, the handle is formed by a small saddle-shaped base (3) which is an integral part of the central blowing body (2) of the appliance and a slant handle (4), pivoted under the base. On the plane of the hangrip facing the saddle-shaped base, a semicircular groove (10) and a few hemispheric seats (12) are cutted to allow a rotation of 180 DEG of the handle and its fastening in the different possible positions.
