Abstract (en)
[origin: EP0180706A2] Conveyor means which can be equipped for carrying out various sequences of predetermined technological operations, while even after modification of the operating speed, the quantities of fluids supplied or introduced into the inside of each of the continuously passing containers (13) remain constant. The position of the conveying element (9) in comparison with the container transport table (44) located at a level remaining constant relative to the floor, can be adjusted depending on the level of the body of the container (13), in order to enable the contents of containers (13) located at different levels to be detected, removed and transported, without having to change the position and the format of the plurality of gripping elements (10). <IMAGE>
