Abstract (en)  
[origin: EP0181444A2] The invention relates to a suspension device having a trolley (1) which is movable on rollers (4) in a track (6) and having a supporting stirrup (14) arranged thereon for a sliding door or the like, the trolley consisting of a plastic housing (2) which possesses a recess (8) into which an annular segment (7) is inserted, to which the supporting stirrup (14) is attached. The frictional pairing of plastic and metal guarantees a low-friction reciprocating motion of the supporting stirrup within the limitations imposed by the design, the annular segment (7) sliding on a sliding surface (9) within the housing (2). A supporting stirrup (14) of any desired design is attached by a nut (13) to the screw (12) which is passed through an aperture (11) in the housing (2) and connected to the annular segment (7). <IMAGE>
