Abstract (en)

1. Antistatic or electrically semi-conductive thermoplastic polymer blends based on organic polymers, electrically conductive substances and the usual additives, characterized in that, they contain two partially compatible thermoplastic polymers A and B, of which polymer A at a given temperature has a lower melting viscosity in comparison to polymer B and between which there is a solubility-parameter difference of approximately $0.3 \text{ to } 1.5 \text{ (cal/cm}^3)^{1/2}$, in which the polymer A, which forms the continuous phase, essentially contains the electrically conductive substances.
