Abstract (en)
[origin: EP0181591A1] 1. Support for a lying or sitting person with a shaped support body (1, 12, 19, 22, 38) of a resilient material which rests on a shaped bearing body (2) and, when pressure (10, 18) is exerted from above, exerts on the person a stretching action (11, 17) proceeding from the pressure centre point (10, 18) to the right and the left, characterized in that the shaped support body (1, 12, 19, 22, 38) is provided with folds extending transversely to the support so that stretching of its projected length occurs in the area under pressure, and in that between the shaped support body (1, 12, 19, 22, 38) and the shaped bearing body (2) movably mounted spring elements (6, 13, 14) are provided which make possible the longitudinal stretching of the shaped support body (1, 12, 19, 22, 38).
