Abstract (en)
[origin: EP0182065A2] In a plug-and-socket connection, consisting of a blade strip (1) and a spring strip (2), the end regions (3) of the longitudinal walls (6) of the blade strip (1) are raised and chamfered towards the inside. At the same time, the end regions (9) of the longitudinal edges of the spring strip (2) are correspondingly chamfered. In this way, an initial guide of greater tolerance is provided for the plug insertion process, by which means the plug insertion process can be designed more safely. <IMAGE>
