Abstract (en)

[origin: EP0182403A2] The gasification is carried out in the pressure range from 5 to 150 bar with oxygen, steam and/or carbon dioxide as gasifying agent, the pellets being added in the reactor on top of a solids bed which moves slowly downwards and into which the gasifying agent is introduced from below, the mineral constituents being taken off at the bottom as solid ash or molten slag. To produce the pellets, a mixture is first prepared which contains at least 80% by weight of fine-grained hard lignite of a grain size of at most 1 mm. The mixture to be pelleted has a water and moisture content from 10 to 25% by weight and a bentonite content from 4 to 10% by weight. With addition of water as pelletizing fluid, moist pellets are formed from the mixture, which have a water and moisture content from 25 to 35% by weight. The moist pellets are dried in a steam-rich atmosphere, the core of the pellets being heated to at least 90 DEG C before the pellets leave one tenth or more of their water content. The dried pellets have a water and moisture content of at most 4% by weight. The moist pellets can be dried, for example, in a sand bed. <IMAGE>
