Abstract (en)

[origin: EP0182727A2] A lifting device comprising a welded chassis 1 on which is fixed in an articulated manner at its lower part a single vertical tubular post 3 along which moves a movable carriage 16 supporting an elevator drawn by a cable actuated by a manual or electric winch. The length of the post may be increased by inserting nestable elements into one another. The winch is fixed onto a winch support 12 which is connected to the chassis and which locks the post in a vertical position. For transporting and handling the device, the post folds in a horizontal position over the chassis and receives the winch support. For assembly, the winch support is unfolded into a vertical position and locked by means of the two struts 14, then the winch by pulling on the cable directs the post into a vertical position; it remains only to install the pins 6 and 9 for locking the post. The movable carriage may be equipped with a safety brake which locks the carriage and its assembly to the post in the event of the cable breaking.
