Abstract (en)  
[origin: EP0183434A1] A garment hanger comprises a support bar (1) over which a garment is folded when the hanger is in use, and a friction bar (11), arranged substantially parallel to the support bar and spaced therefrom on the side of the support bar remote from the point from which the hanger is suspended in use, the friction bar being out of the plane in which the support bar and the point of suspension lie. The asymmetry of the hanger means that a garment can be arranged on the hanger in either of two ways, so as to accommodate garments of different thicknesses.
