Abstract (en)

[origin: EP0183867A1] An electromagnetic relay for use in a high-frequency circuit includes an armature (3) mounted on a central shaft (16) for pivotal movement between two switching positions. A total of four actuator cards (5) are disposed on two opposite sides of the armature (3) each card carrying a contact spring (8). Each contact spring serves to bridge a pair of fixed contacts (6, 7). The contact springs and fixed contacts are located in shield casings (9) disposed on both sides of the armature (3). Return springs (19) urge the cards (5) into abutment with the respective sides of the armature (3). Sufficient electrical separation as required for high-frequency applications is achieved between the two contact systems due to the intermediate disposition of the armature (3). The provision of an individual actuator card (5) for each contact spring (8) permits independent adjustment of each contact.
