Abstract (en)
A display control system for use in a display system (10) having digital interfaces is disclosed which, when software using color display is executed (CG33, 14 & 15) in the display system (10) with digital interfaces, is capable of distinguishing the display contents thereof from one another. Specifically, the display control system (10) is adapted to generate a given number of pieces of brightness information different from one another in duty correspondingly to respective pieces of color code information or brightness code information, to set up the dots of a display screen (20) in two mutually adjacent areas, and to shift the above-mentioned brightness information to be given to one of the above-mentioned areas from the above-mentioned brightness information to be given to the other area in phase. Also, a the above-mentioned code information may be converted into hatch patterns correspondingly to the dot and raster positions in display means (20).
