Abstract (en)

This invention relates to a hand traffic signal for crossing the street, assigned to show the intention of the pedestrian to cross the street, particularly dedicated to children and aged people. The signal consists of housing, made of the two same and symmetrical halves, having slides on the inner surfaces, for sliding the handle while retracting. At the upper part of the sliding area, a stopper is positioned, and on the lower part two transversal slots are made. The halves have symmetrically positioned cotters and holes for proper positioning and fastening together, and a central opening each for positioning the catadioptric plate. An axially slidable handle is positioned inside the body, made of one piece of material, according to one embodiment, or consisting of the two telescopic parts, according to the other embodiment.
