Abstract (en)

[origin: EP0187356A2] The invention relates to a roof element having high air sound insulation characteristics, which is characterised in that it consists of a statically bearing plate element, on which a further plate element of an inorganic substance having high internal insulation characteristics is arranged, which, in turn, carries a plate element of an insulating substance known per se. This plate element of an insulating substance known per se is preferably a foam glass plate element. The plate element of an insulating substance known per se may be coated with a cover layer known per se. The abovementioned plate elements are preferably glued together or connected by mechanical means. The plate element of an inorganic plastic material having high internal insulation characteristics preferably consists of gypsum, gypsum fibres, gypsum hardboard or calcium silicate. <IMAGE>
