Abstract (en)
[origin: WO8600361A1] A panelling system essentially for use on walls where the first panneling element (upper board 11) is constructed with an undercut along its two undersides, a second panelling element (lower board 12), with a protrusion along both of its side edges, which matches the undercuts (14) on the first panelling element and a third strip-shaped panelling element (52) with an edge thickness equal that of the undercut of the first panneling element (11). On each of said first and second panelling elements there are two or more attachment elements (attachment clips 13), which are constructed for fixing under the panelling elements along at least one side. The attachment elements can be affixed to a surface by screws etc. It is of special interest that the first paneling element has grooves on both sides and the second panelling element corresponding tongues on both of its sides.
