Abstract (en)

[origin: EP0189521A2] The container is designed in particular in the manner of a tube and has dispensing pistons (9), for example for deodorant sticks, lipsticks or the like, and its sleeve-shaped housing (1), which is closed by a cap-shaped lid (4), is wider in cross-section at the bottom edge than in the cylindrical central portion. To achieve a constructional shape which is favourable for filling and advantageous in production and use, it is proposed that the lower cross-sectional broadening is formed by a continuously outwardly directed curving (B) of the casing wall (W), the inside surface (1') of the housing wall being roughened at least in the cylindrical region adjoining the curving (B) (roughened region x). <IMAGE>
