Abstract (en)

Centerfold forming apparatus for making an envelope for a plastic disk from a prepunched, flexible, plastic blank having two sections connected at the heads thereof and containing a drive hole at the same location in each section; the flexible plastic material blank (10) is held against two outward surfaces (32,33) of a first and second folding plate (21,23) that are pivoted in the middle (28) so that the plates (21, 23) are driven in an arcuate path until said outward surfaces (32,33) are positioned in vertical planes facing each other; the drive holes in each section of the flexible blank are fitted over respective hubs (35,35 min ) located in the same location in said surface (32,33) of each first and second folding plate (21,23); a mandrel (34) which is extendable vertically and has an edge thereof in the extended position pressing against the blank (10) in the area between the first and second plates pulling the drive holes in the blank taut on said hubs (35,35 min ) thereby locating the centerline of said blank; drive means moving the folding plates (21,23) from the horizontal to the vertical facing position causing said blank (10) to bend along the pressing edge of said mandrel (34) forming the centerfold; heating means are provided for heating the centerfold to a predetermined temperature to anneal the material thereby reducing internal stresses therein.
