Abstract (en)  
[origin: EP0191743A2] A locking device to secure a pair of skis (13) from theft, by means of a previously known locking means (15). It comprises an outer operating knob member (15a) and an inner member (15b) with an inner screw thread, which inner member in locked position is disengaged from the outer member. The inner member cooperates with a locking bolt (17) having an outer screw thread and which bolt protrudes from a base plate (18) affixed to a supporting structure (10, 11). The base plate has at least one block pin (20) in parallel with and on each side of the locking bolt. A blocking plate (22) has apertures (23, 24) corresponding to the bolt and the pins and is placeable along these until it abuts the side edges of a pair of skis between the bolt and the pins, through tightening of the locking means (15) by screwing it on the locking bolt towards the blocking plate (22).
