Abstract (en)

[origin: DE3506027A1] The invention relates to an elastic attachment device for a sprung slat on the support frame, having a spring element which is attached at one end to the support frame and at the other end to the sprung slat and which extends from the support frame in the longitudinal direction of the sprung slat up to the frame centre, the sprung slat ending above the support frame terminating approximately with the outer edge of the support frame, and the spring element being constructed as a component which is U-shaped in the vertical plane, whose lower limb is attached by its free end to the support frame and whose upper limb bears the sprung slat approximately at the end in a positive-locking manner.
