Abstract (en)

[origin: EP0192825A2] The container (1) is designed in the manner of a tube, which can be closed by a lid, and has a discharge piston (2) and an air passage zone assigned to the latter. In order to achieve a shape which is simple in terms of manufacture and reliably evacuates the enclosed air, it is proposed that the discharge piston (2) has two piston plates (a, b), which are connected to each other by a bush (7), and the air passes into the annular space (R) between the two piston plates (a, b) and, from there, passes by the one piston plate (b).
