Abstract (en)
[origin: EP0193017A1] 1. Apparatus for the electromechanical operation of a bolt (9) positioned in a lock (1) for releasing a locked escape door (51), with an electromagnetically controllable lever bar (29, 33) by means of which the bolt (9) is blocked if current flows in an electromagnet (3) and is released if the electromagnet (3) is currentless, and in the released state the bolt is slid back from the closed position into the open position by pressure action at right angles to the bolt movement direction, characterized in that between bolt (9) and lever bar (29, 33) is provided a catch (7) and that in the blocking position catch (7) is supported in casing-fixed manner against the movement direction of bolt (9).
