Abstract (en)
[origin: EP0194136A2] An electronic timepiece comprises an oscillator (₁) for generating a time standard signal; a frequency divider (18) for receiving the time standard signal and producing therefrom time signals; pulse generating circuits (19; 20, 21, 22, 30) receiving the time signals; driving circuits (24, 30) connected to receive pulses from the pulse generating circuits; step motors (25, 31) driven by the driving circuits; energy supplementary source (1) such as a solar cell for generating electric energy; and a capacitor (5) for storing electrical energy. A detecting circuit (6) detects the voltage on the capacitor and generates a signal in order to stop at least one of the motors. A counting circuit (27) counts the time for which said one motor is stopped by the detecting circuit and a control circuit (22) drives the motor that has been stopped to position a hand driven thereby to the present time indication under the control of the counting circuit when the detecting circuit no longer generates the signal to stop that motor.
